

Performance

TLDR

1. Stick to Transform and Opacity when animating with CSS: <https://csstriggers.com/>
2. When implementing complex animations, think about what has to use Vue's reactive system
3. Think about the number of elements being animated. Maybe it could be replaced by a sprite animation?

Exercise

Your turn!

Let's use the final time we have so you can work on something yours. It can be a project that you already have and would like help with, or you can create something based on today's example from scratch in codesandbox.

I'm here to help ❤️
